

Escallonia - Care Guide

Growing Escallonia

Escallonia are evergreen shrubs from South America that are most easily split into two distinct categories or groups. There are species and varieties which make excellent freestanding plants in shrub borders, or in a woodland setting, and there are those species and varieties which are most commonly used as garden hedges.

In the wild Escallonia grow in woodland and scrub where they will achieve a height of 8-10ft in maturity. Typically they have oval glossy leaves and terminal racemes of white, pink or red flowers over a long period in the summer. The varieties which we currently grow in the nursery are perfectly hardy in a normal winter and are excellent in coastal locations when exposed to strong winds and salt spray. A certain amount of browning and defoliation of the leaves after severe storms should be no great cause for concern as they will quickly and resiliently reshoot albeit with some occasional dieback.

Escallonia can be propagated from semi-ripe cuttings in late summer. We find it easiest to propagate the hedging varieties as hardwood cuttings taken in late autumn and set out in rows in a field context. This produces larger, more saleable, plants more quickly.

Ornamental Varieties Of Escallonia

E. 'Iveyi' is perhaps my personal favourite. Mr Ivey was a gardener at Caerhays who, in the early 1920s, crossed two species, *E. bifida* and *E. x exoniensis*, to create this new hybrid. It has a vigorous and upright habit with glossy foliage and large panicles of white flowers mainly in the late summer and autumn. These are a major attraction to late season butterflies and fritillaries in particular. It grows at Caerhays in large clumps which are cut down to rejuvenate them every 20 years or so.

Escallonia 'Red Carpet'

Escallonia hedges require quite a bit of attention to keep them in shape and are normally no more than 3-5ft in height having been planted as a double row some 18in apart with 18in spacings between plants. Pruning should take place once a year when flowering has finished in the late summer or autumn. As Escallonia flower only on the new growth you have to give the hedge time to grow new shoots to give a decent flowering effect next season.

E. rubra 'Crimson Spire' is a strong growing shrub with dark glistening green leaves and bright crimson flowers.
