Cupressus - Growing Guide

Cupressus - Growing Guide

Cypress

There are around 15 species of coniferous cypress of which Burncoose stocks only a few with quite varied uses, applications and hardiness in the garden.

Cupressus macrocarpa is a huge growing (100ft) Californian species which is one of the great stalwart trees in coastal locations. It is extremely tolerant of salt laden gales and has grown in the very teeth of the wind in near sand at Porthluney Cove and in so many other south coast maritime villages and towns. Branches will split and fall in gales from mature trees but the foliage will not brown off like so many other conifers. The leaves are lemon scented and larger trees will produce a plethora of rounded cones which can be gathered and ripened over winter for sowing in the spring. They germinate easily.
